1) An arrow is fired straight up into the air at an initial speed of $137.2 \mathrm{~m} / \mathrm{s}$. How long does it take to reach its high point?

How high does it go?
2) What is the acceleration of a gorilla that has an initial speed of $2 \mathrm{~m} / \mathrm{s}$ and travels 45 m in 5 s ?

$$
\mathrm{d}=\mathrm{vt} \quad \mathrm{v}_{\mathrm{f}}=\mathrm{v}_{\mathrm{i}}+\mathrm{at} \quad \mathrm{~d}=\mathrm{v}_{\mathrm{i}} \mathrm{t}+(1 / 2) \mathrm{at}^{2} \quad \mathrm{~g}=9.8 \mathrm{~m} / \mathrm{s}^{2}
$$

3) A person starts from rest and accelerates at $2 \mathrm{~m} / \mathrm{s}^{2}$ for 5 s . They run at their new speed for the next 10 s . Then, they decelerate at $(-) 2.5 \mathrm{~m} / \mathrm{s}^{2}$ until they come to a rest. How far did they travel all together?
